

# 242Konnnect Lite package

The same 242Konnnect app at half the download size:  
the files to deploy, the screens they contain, how to  
put them online and how they were tested.

---

**0.95 MB**

lite package (was 1.8 MB)

**-47 %**

download size

**0**

changes to the app code

# Three files, one app

All three contain the same version of 242Konnnect: PIN log-in, accounts and profiles stored in Supabase, the shared marketplace, French and English. They differ only in size and in how you put them online.

RECOMMENDED

**0.95 MB**

`242konnnect-netlify-package-lite.zip`

Drag onto Netlify Drop. Smallest download.

**2.7 MB**

`242konnnect-lite.html`

One file with everything inside. For uploads that refuse .zip; opens from anywhere.

**1.8 MB**

`242konnnect-netlify-package.zip`

The original, untrimmed package.

## What “lite” changes, and what it does not

| PART                         | FULL    | LITE    | HOW                                                                                                                         |
|------------------------------|---------|---------|-----------------------------------------------------------------------------------------------------------------------------|
| Fonts (Inter ×4, Manrope ×2) | 1.57 MB | 0.46 MB | Kept only the characters French and English use: Latin, accents, punctuation, €, ★. Cyrillic, Greek and Vietnamese removed. |
| Photos (5)                   | 0.64 MB | 0.30 MB | Capped at 800 px, which is still sharp on a high-resolution phone screen.                                                   |
| App code                     | 1.40 MB | 1.40 MB | Unchanged. Same features, same behaviour, same file names.                                                                  |
| Zip download                 | 1.79 MB | 0.95 MB | The app code is now most of what remains (~0.4 MB compressed).                                                              |

## Kept apart from the Estevao Tati site

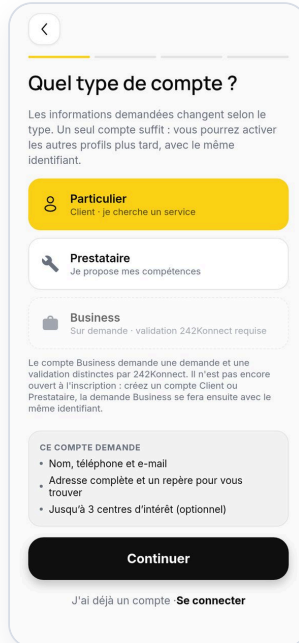

The package builder refuses to finish if anything from the Estevao Tati landing page is found, and the files contain no secret keys. The only key inside is the Supabase publishable key, which is designed to ship in an app.

# From first launch to a protected account

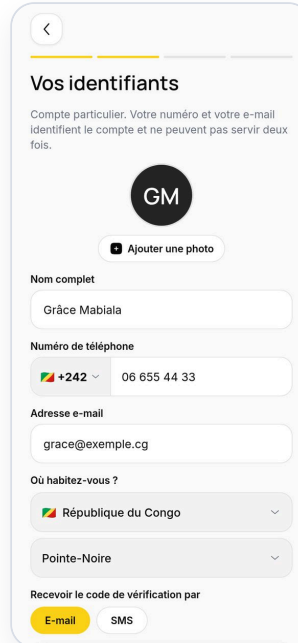

Captured from the lite build with a fictitious demo account. Every account is created in Supabase. The six-digit code is e-mailed by Supabase and never shown in the app.

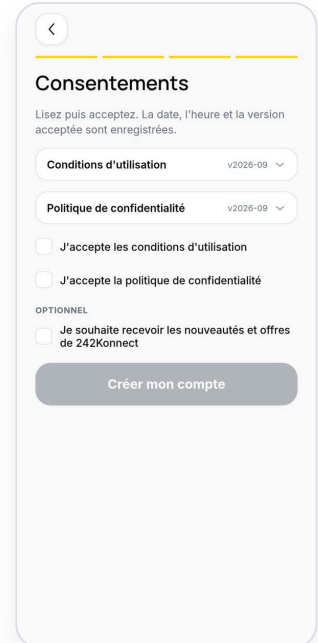

**Welcome**  
Create an account or sign in

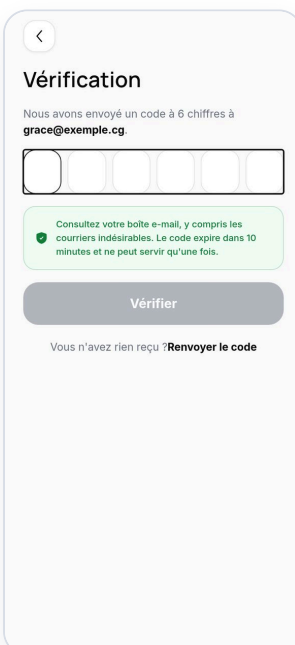

**Account type**  
Particulier or Prestataire

**Identity**  
Name, phone, e-mail,  
country, city

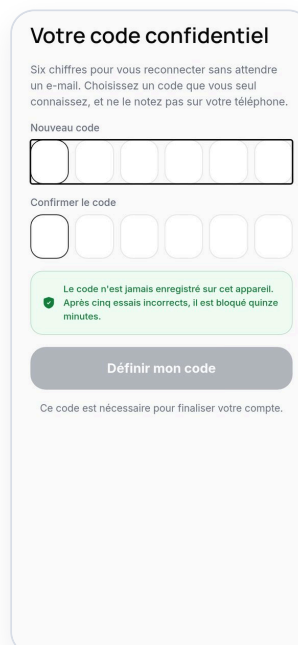

**Consents**  
Versioned terms and privacy  
policy

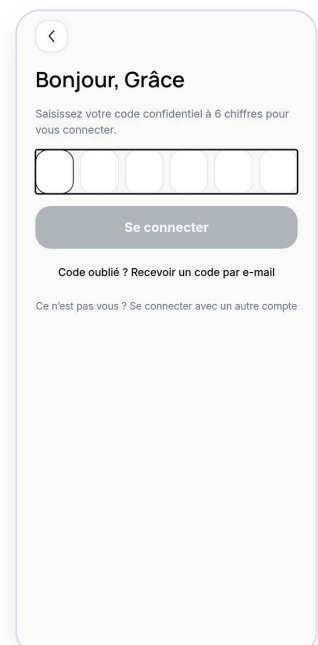

**E-mail code**  
Six digits, valid 10 minutes

**Password**  
Stored by Supabase Auth

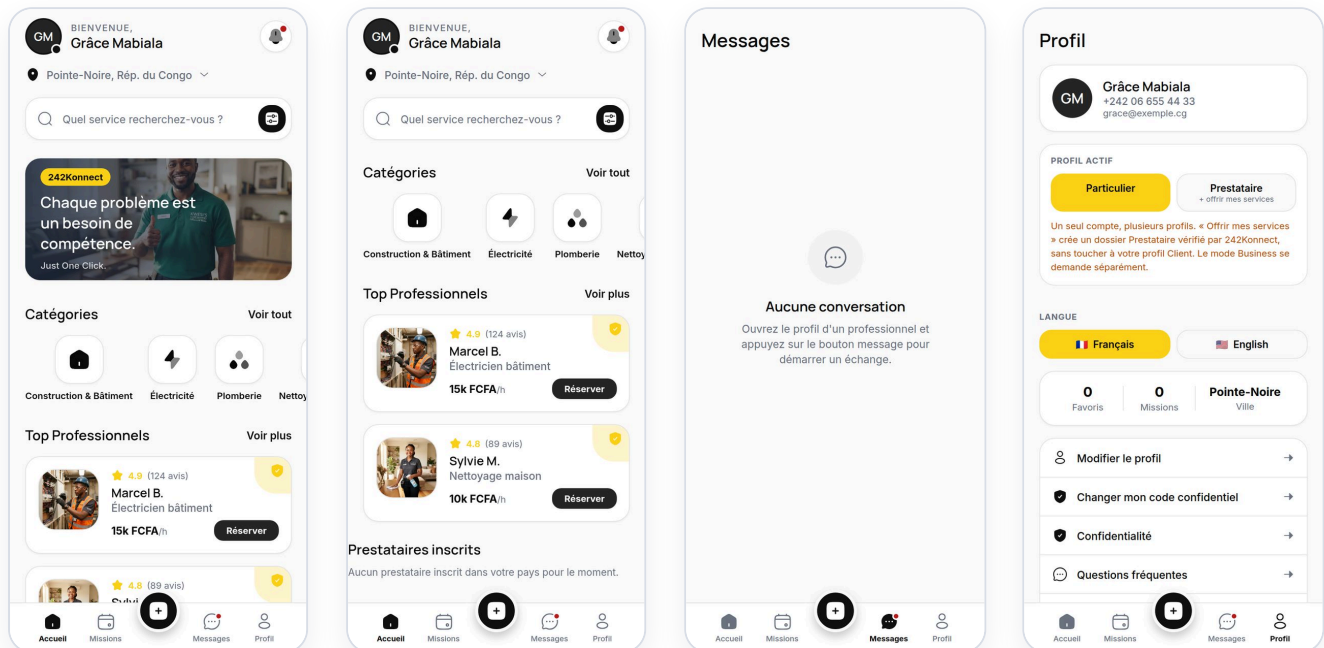

**Personal PIN**  
Checked by the server; 5  
tries, then 15 min lock

**Next launch**  
"Bonjour, Grâce": the PIN  
alone opens the app

## Straight into the marketplace

After the PIN is set, the app opens on Accueil with no extra step. The profile, consents and PIN live in Supabase, so signing in on a new phone brings them back.

### Accueil

Search, categories, top professionals

### Marketplace

"Prestataires inscrits": real providers from Supabase

### Messages

In-app conversations only

### Profil

Switch profile, change PIN, language, privacy

"Prestataires inscrits" is empty on this demo because the stand-in database has no providers. Live, it lists the prestataires registered in Supabase for the user's country.

# Deploy in two minutes

The lite zip is a complete site. Netlify needs no build command and no settings.

## Drag and drop

- 1 Open **app.netlify.com/drop** and sign in.
- 2 Drag `242konnnect-netlify-package-lite.zip` onto the page.
- 3 Netlify gives you an address such as `name.netlify.app`. Open it on a phone and create an account.
- 4 To update an existing site instead: **Site → Deploys**, then drag the zip onto the deploy area.

## Or connected to GitHub (redeploys on every push)

| SETTING                             | VALUE                                                       |
|-------------------------------------|-------------------------------------------------------------|
| Branch                              | <code>claude/sleek-skill-project-1knsscftutfd-0h5mcr</code> |
| Base directory                      | <code>242konnnect-web</code>                                |
| Build command / Functions directory | empty / none                                                |

## Supabase settings to confirm once

- Authentication → Providers → **Email** enabled.
- Minimum password length **8 or less** (the app requires 8, with letters and digits).
- **Secure password change** off, so a password can be set right after the e-mail code.
- E-mail template contains `{{ .Token }}`, so the mail carries the six-digit code.

## Rebuilding the lite files later

`pip install fonttools pillow` then `python3 242konnnect-app/tools/package-web-lite.py`. Full steps are in `242konnnect-app/DEPLOY.md`.

## How it was tested

Every check runs the real build in Chromium. Supabase is replaced by a local stand-in with the same API, because supabase.co cannot be reached from the build environment.

### On the lite files

- Loads at any address depth: **12/12**
- No demo accounts or test data: **14/14**
- All six fonts load; French accents render
- French screens identical to the full build (only the hero photo differs, from recompression)
- Single HTML file opens from disk on phone and desktop sizes, with no errors
- No secret keys; no Estevao Tati content

### On the app itself (build f92453e)

| SUITE                                | PASSED             |
|--------------------------------------|--------------------|
| PIN log-in and Supabase accounts     | <b>18/18</b>       |
| Whole-app walkthrough                | <b>136/136</b>     |
| Prestataire journey                  | <b>30/30</b>       |
| Marketplace journey                  | <b>14/14</b>       |
| Particulier journey                  | <b>12/12</b>       |
| Security headers and site separation | <b>18/18</b>       |
| API service                          | <b>31/31</b>       |
| Translations checked                 | <b>594 strings</b> |

### Known limits

- **Forgotten PIN.** The user can still sign in with an e-mail code but cannot set a new PIN without the old one. The fix is a small change to the live PIN function, waiting for your approval.
- **Phone number on a new phone.** Signing in with a phone number works only on a device that already knows the account; on a new device the e-mail address is needed.
- **Not yet tested on a physical device** or with a real inbox from this environment.

**One decision needed:** approve the PIN-function update so that someone who forgets their PIN can replace it after an e-mail code.
